

COGNITO-DECODE

ORIGIN STATEMENT

Project Identity

Project: COGNITO-DECODE

Title:

Mesleki Eğitim için Üretken Yapay Zekâ Okuryazarlığı ve Epistemik Doğrulama Modeli

Concept & Methodology Developer:

Çiğdem Dayan

Initial documented version: 26 September 2026

Version: 1.0

Purpose of This Statement

This document records the documented origin and initial methodological identity of the COGNITO-DECODE educational model.

The repository is maintained as a dated development record of the model, its methodological components and subsequent revisions.

Conceptual Framework

COGNITO-DECODE is designed for vocational education and training (VET) and focuses on generative AI literacy, question architecture, critical prompting and epistemic verification.

The model is based on a shift:

From AI User to AI Auditor.

Its central pedagogical principle is that an AI-generated response should not automatically be treated as verified knowledge. Learners are expected to identify claims, isolate questionable information, seek appropriate evidence, verify sources, challenge AI outputs and produce their own evidence-based synthesis.

Core Methodological Components

- R-G-B-K Prompt Architecture
- AI Auditor approach
- Epistemic Verification Protocol
- Prompt Audit Trail
- Prompt Passport
- Evidence-Based Human Synthesis

These components are documented and developed as parts of the COGNITO-DECODE methodological framework.

Development Status

At the time of this statement, COGNITO-DECODE is an educational model and methodology under development.

Future versions may refine, expand or reorganize the model and its associated tools. Such changes will be recorded through dated version updates in this repository.

Version Record

v1.0 — 26 September 2026

Initial documented version of the COGNITO-DECODE model and its methodological identity.

Attribution

The COGNITO-DECODE model and the methodological framework documented in this repository are developed by Çiğdem Dayan.

This statement records the documented development history of the model and is not a claim that the repository itself constitutes a formal intellectual-property registration or trademark registration.
